Introduction

Ethyleneimine (EI) has high reactivity, and it is used and well known as pharmaceutical intermediate product and / or raw material of amine polymer.

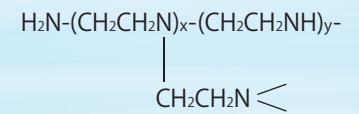

Since we have commercialized EI in 1969 using by WENKER Method, NIPPON SHOKUBAI have pursued production method, which minimized waste disposal, and successfully developed "The Vapor Phase Method", which ecologically materialize minimal resource. This was the first development in the world using by own developed new catalyst technology in 1990.

As the result of making best efforts to utilize high reactivity of EI , NIPPON SHOKUBAI would develop Ethyleneimine derivatives such as pharmaceutical intermediate products, amine containing polymers and cross-linking agents.

We would like to present standard types of EI derivatives,
EPOMIN (Polyethyleneimine),
POLYMENT (Aminoethylated acrylic polymer) in this catalogue.

EPOMIN

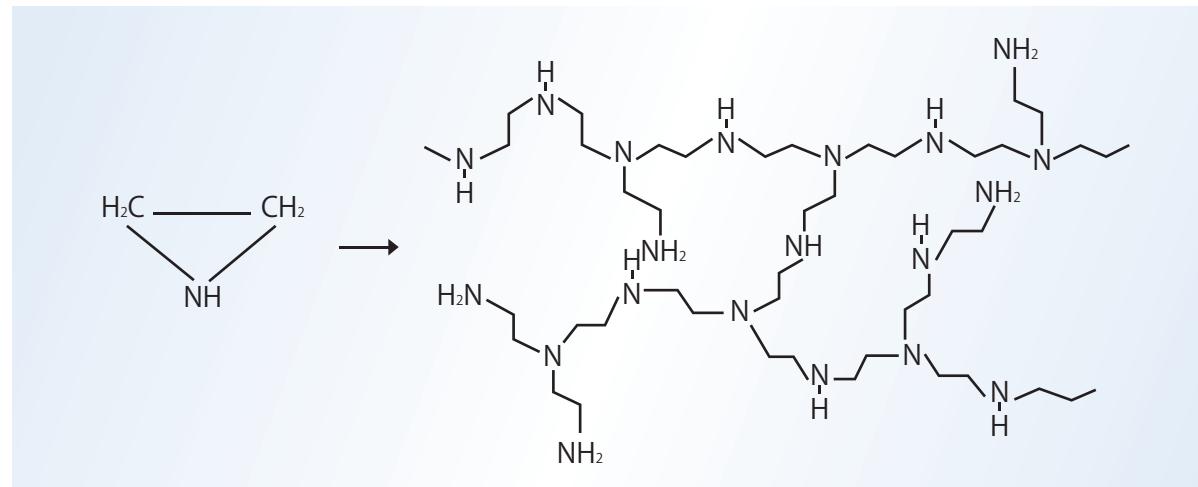

(Polyethyleneimine)

Polyethyleneimine **EPOMIN** is a water-soluble polymer made by the polymerization of ethyleneimine. **EPOMIN** is not an entirely linear polymer; it has a highly-branched structure that contains primary, secondary, and tertiary amines.

Characteristics

- It is the highest cation-dense polymer in existence.
- It is a very high reactive polymer.
- It is a water-soluble polymer.

Manufacturing method of EPOMIN

Product line of EPOMIN

Product	SP-003	SP-006	SP-012	SP-018	SP-200	HM-2000	P-1050	P-3000 (in development)
Mw	300	600	1,200	1,800	10,000	30,000	70,000	100,000
Spec.	Resin cont. (wt%)	>98	>98	>98	>98	93~95	50±2	35±1
Viscosity (mPa·s/25°C)	200 -500	500 -2,500	3,500 -7,500	8,500 -15,000	40,000 -150,000	5,000 (50% aqueous solution)	5,000 -15,000	1,300 -2,600
pH(5%aq.)	10-12							
Appearance	Colorless or light yellow liquid							

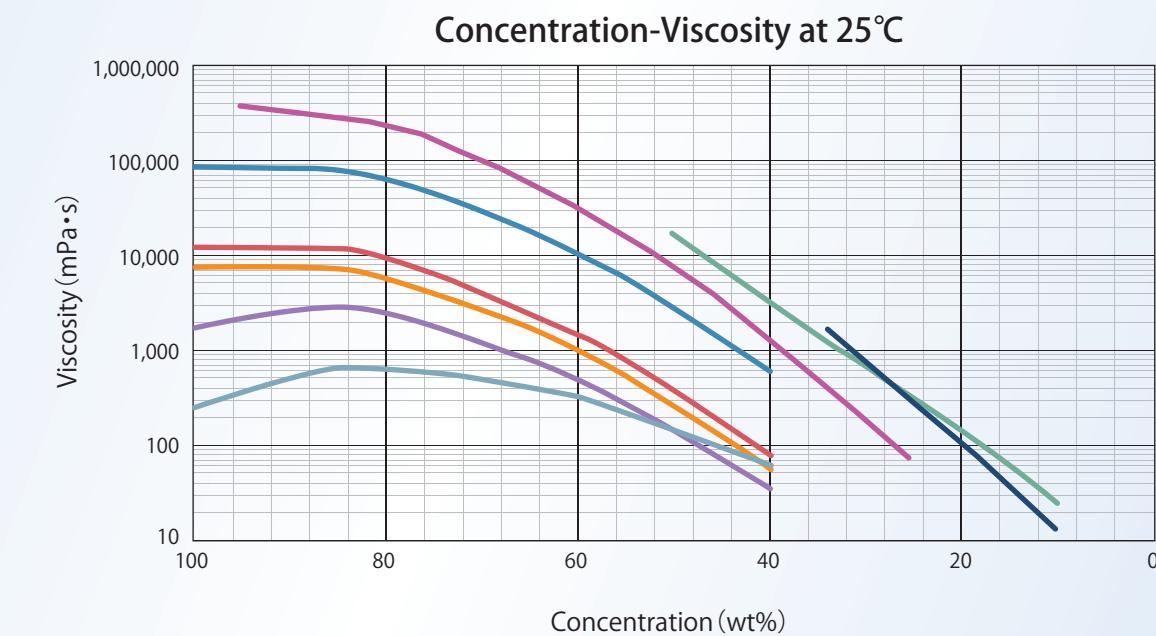

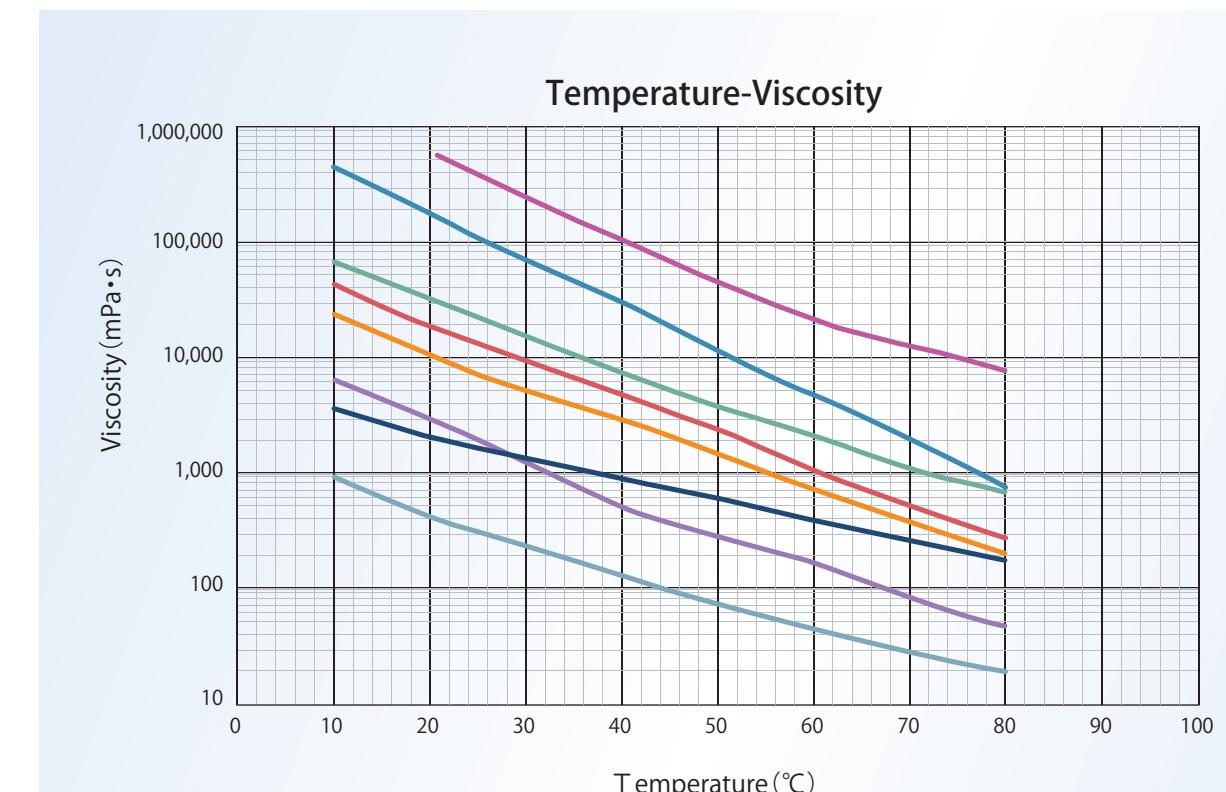

* The specs for P-3000 are provisional.
* Molecular weight is not in specification.

Viscosity of EPOMIN

The viscosity of **EPOMIN** greatly varies depending on its molecular weight, temperature and concentration when diluted in water.

The graphs below show the relationship between temperature v.s. viscosity and concentration v.s. viscosity.

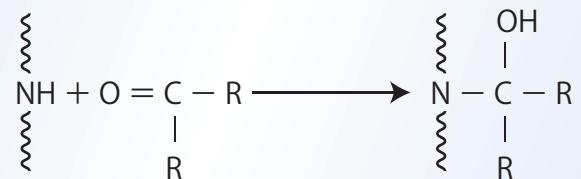

SP-003 SP-200
SP-006 HM-2000
SP-012 P-1050
SP-018 P-3000

Chemical reactivity of EPOMIN

Having diversity in chemical reactivity like low molecular amine, **EPOMIN** can be modified chemically in variety. Typical examples of **EPOMIN** reactivity are illustrated below.

1 Reaction with aldehydes and ketones

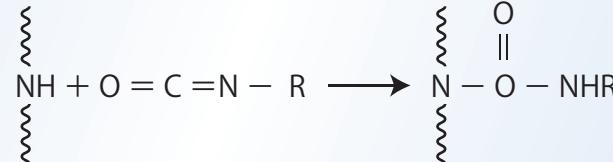

EPOMIN can form cross-link through reaction with dialdehyde.

2 Reaction with alkyl halides

EPOMIN can be alkylated with alkyl halides.

3 Reaction with isocyanates and thioisocyanates

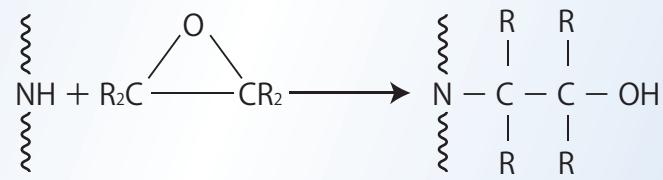

EPOMIN reacts with isocyanates.

4 Reaction with acryloyl compounds

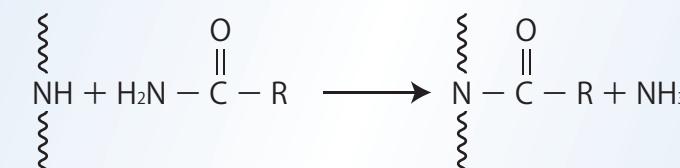

EPOMIN reacts with acrylic monomers.
(Michael addition)

5 Reaction with epoxy compounds

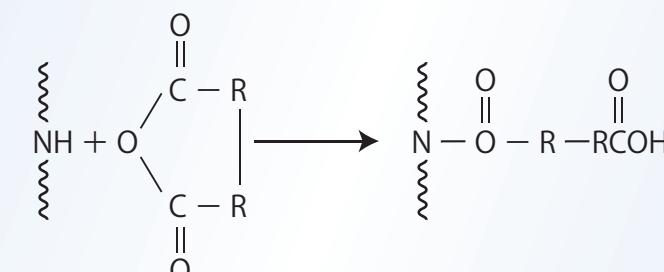

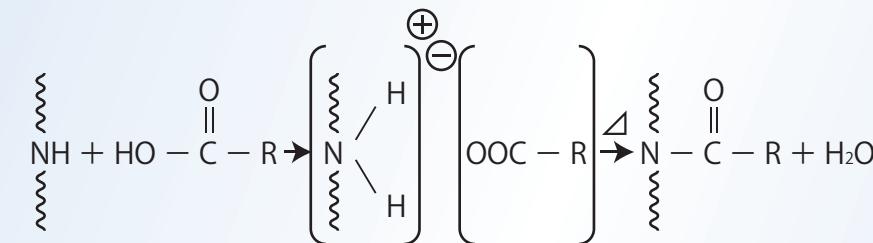

EPOMIN reacts with epoxy compounds.

6 Reaction with cyanamide, guanidine, urea.

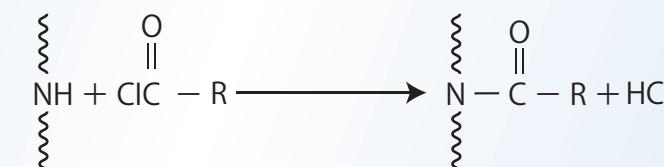

EPOMIN reacts with cyanamide, guanidine and urea.

7 Reaction with acid, acid anhydrides and acylhalides

EPOMIN reacts with carboxylic acid derivatives.

Functions and Applications of EPOMIN

1) Functions of EPOMIN

► High adhesion and absorption

The amino group forms hydrogen bonds with hydroxyl group, ionic bonds with carboxyl group, and covalent bonds with the aldehyde group and ketone group. **EPOMIN** also has polar group (amino group) and hydrophobic group (ethylene group) in its structure, which enhances its bonding force with materials of different polarities. These comprehensive bonding forces of **EPOMIN** are utilized in fields such as adhesion, ink, paint, and pressure-sensitive adhesive agents.

► High cationicity

EPOMIN exists as polycation in water, and it neutralizes and adsorbs all types of anionic materials. **EPOMIN** also chelates heavy metal ions. This highly cationic property of **EPOMIN** is utilized in fields such as paper manufacturing, water treatment, plating bath agents, dispersants, etc.

► High reactivity

Because of its reactive primary and secondary amino group, **EPOMIN** easily reacts with epoxy, aldehyde, isocyanate compounds, and acid gases. This highly reactive property of **EPOMIN** is utilized in the modification of epoxy resins, aldehyde adsorbents and dye-fixing agents.

2) Industrial applications of EPOMIN

Field	Applications	Recommended Products	Characteristics
Paper	Paper making agent	P-1050	Neutralization of an anion charging material Retention agent Pitch controller White water treatment Dispersion and retention of ketene dimmer
Adhesion	Pressure sensitive adhesion	SP-200 P-1050	Improve in holding power
	PVC sol adhesive	SP-018 SP-200	Adhesion promoter
	Water based adhesive	SP-200 P-1050	Adhesion promoter for EVA, Poly vinyl acetate, PVA and Acryl emulsion.
	Anchor coat agent for extrusion laminate	P-1050	Adhesion promoter for extrusion polyethylene with Paper, Olefin film.
	Anchor coat agent for gas barrier film	P-1050	Adhesion promoter for PVA, EVOH with Olefin film
	Release agent	RP-20	Backside release agent for the various tapes.
Paint / ink	Polyvinylbutyral based ink	SP-200	Adhesion promoter.
	Acryl emulsion based paint	SP-012 SP-018	Fast drying, adhesion promoter and water resistance

Field	Applications	Recommended Products	Characteristics
Textile	Dye fixing agent	P-1050	Washing resistance and dyeing promoters
	Surface modification of tire cord	P-1050	Adhesion improvement PET cord with rubber.
	Sizing agent for glass fiber	P-1050	Lubricity
	Fixing of fire retardant	P-1050	Retention agent for fire retardant (phosphorous type)
Liquid cleaning	Liquid clarifier	P-1050	Removal of chlorine and aldehydes.
	Coagulant	P-1050	Anionic trash scavenging, charge modification and emulsion breaking
	Bacterial cell flocculant agent	P-1050	Bacteria removal
	Chelating agent	P-1050	Metal extraction
Gas cleaning	Gas scavenger	P-1050	Absorb of CO ₂ , NO _x , SO _x , Cl ₂ and aldehydes.
Dispersion	Dispersing agent	SP-012	EPOMIN can disperse ceramic, carbon black, coal, cement, metal powder, pigment.
Metal plating	Metal plating bath agent	SP-006	Brightener, smooth agent for Zn plating.
	Corrosion inhibitor for acid pickling, Primary rust inhibitor	P-1050	Corrosion inhibitor for iron.
Enzyme immobilization	Immobilized enzyme, Microorganism immobilized carrier	P-1050	Fixation agent to carrier for enzyme, microorganism.
Petroleum	Petroleum emulsion breaker, Fluid loss agent	P-1050	Fluid loss agent for cement slurry.
Antimicrobe / preservation	Antibacterial / Sanitization polymer	P-1050	Ag, Cu complex PEI shows antibacterial.
	Wood preservative, Cut flowers preservative	SP-018	PEI complex (Ag, Cu / PEI) shows antibacterial and permeability.

※ In using our products (**EPOMIN**) in relation to the application referred to in this booklet, please pay attention to existence of the intellectual property rights (including patent and its application) owned by any third parties and avoid the possible infringement of such intellectual property rights. NIPPON SHOKUBAI shall in no event be responsible for any damages or liabilities caused by infringement or alleged infringement of said intellectual property rights due to the above-mentioned use of our products.

Properties of EPOMIN

*1 ○ : Soluble, △ : Partly soluble, × : Insoluble

The above properties are representative values and are not guaranteed.

►Analysis methods

- 1.Molecular weight (1) SP series : Number average molecular weight (Mn) by ebullioscopic method.
- (2) P series : Number average molecular weight (Mn) by osmotic pressure method.
- 2.Amine value : Acidimetry in non-aqueous system
- 3.Decomposition temperature : Differential scanning calorimetry (DSC) was used in N₂ atmosphere.
- 4.Flash point : Cleveland open tester
- 5.Amine ratio : NMR(¹³C)

Use in the food field and Handling of EPOMIN

Use in the food field of EPOMIN

When I use EPOMIN in the food field, please confirm regulations / statute related to safety.

►FDA information :

FDA publication circumstance of Polyethyleneimine

Polyethyleneimine having CAS No .9002-98-6 is published by the following 1), 2), of 3). In addition, polyethyleneimine having CAS No .68130-97-2 is published by the following short-term work of 4).

- | | |
|------------------------|--|
| 1) Adhesive industry | : Part 175 Indirect food additives:Adhesive coating and component.
•175.105 Adhesives
•175.320 Resinous and polymeric coatings for polyolefin films. |
| 2) Paperboard industry | : Part 176 Indirect food additives: Paper and paperboard components.
•176.170 Components of paper and paperboard in contact with aqueous and fatty food.(Limited to use at a level not to exceed 5% by weight of finished dry paper or paperboard fibers.)

•173.357 Materials used for fixing agent in the immobilization of enzyme preparations. |

Handling precaution of EPOMIN

1) Storage stability

(SP series, HM-2000)

►This product will keep stable for about one year when stored in a cool and dark place. However, if the product comes into contact with the air (oxygen), its quality may deteriorate such as coloring occurring or film forming on the surface.

►Please take care when storing the product, as it is highly hygroscopic, and absorbs carbon dioxide gas in the air.

(P-1050, P-3000)

►This product will keep stable for about one year when stored in a cool and dark place. However, if the product comes into contact with the air (oxygen), its quality may deteriorate such as coloring occurring.

►Please take care when storing the product, as it absorbs carbon dioxide gas in the air.

2) Heating of container

The container EPOMIN is inner-coated with synthetic resin.

When heated long at high temperature, the container coating may come off and the product may be colored.

If necessary, heating should be done with hot water at lower temperature than 80°C.

3) Applicable materials

►Suitable materials

Stainless steel, Synthetic resin (PVC,PE,PP), Synthetic resin coating (such as epoxy)

►Not Suitable materials

•Iron materials such as soft iron.

*Should be avoided to prevent coloring caused by rust.

*Such materials should not be used, particularly for EPOMIN aqueous solution, because iron rust tends to harden polyethyleneimine in the solution.

•Copper and copper-containing alloys such as brass

*React with polyethyleneimine and forms bluish green complex salt

4) Storage condition

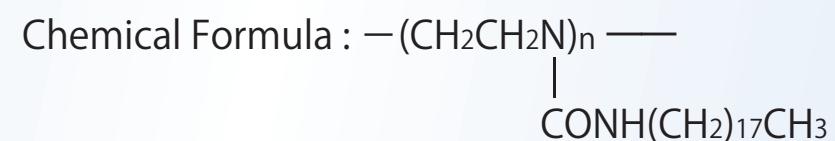

Keep away from direct sunlight, rain, heat and flame. Keep container closed and store in a dark and cool place when not in use.

Modified Polyethyleneimine

1) Octadecyl isocyanate modified polyethyleneimine

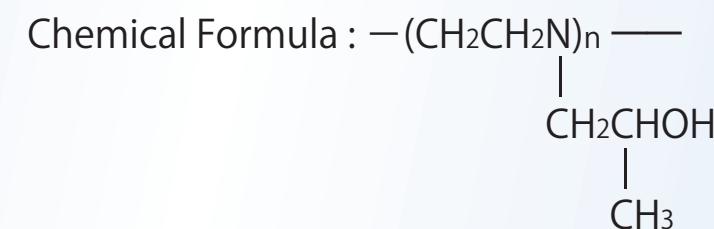

RP-20 is the modified polyethyleneimine reacted with octadecyl isocyanate.

RP-20 has two functionalities: being in the hydrophilic amino group and lipophilic (hydrophobic: C18). By using these functions, RP-20 shows an exceptional effect as a rear-side release agent of pressure-sensitive adhesive tape which base materials are polyester, polyethylene, polypropylene, cellophane, and paper, etc.

2) Propylene oxide modified polyethyleneimine

PP-061 is the addition product of polyethyleneimine with propylene oxide, it is the tertiary polyamine.

Product		RP-20
Spec.	Appearance	Slight yellow powder
Property	Melting point(°C)	87.0~95.0
Spec.	Toluene solubility (10°C)	No turbidity
Property	Loss on drying (wt%)	<2.0
Spec.	Recommended diluent solvent	Toluene
Property	Solubility	Soluble in toluene, xylene Insoluble in water, alcohol
Spec.	Acute oral toxicity LD50 (mg/kg.rat)	>2000
Property	Skin irritation (rabbit)	None
Spec.	Ames test	Negative
Property	Dust explosion	Lower explosive limit:40g/m³
CAS No.		68441-25-8

Product		PP-061
Spec.	Appearance	transparence liquid
Property	Resin content(wt%)	48.0-52.0
Spec.	Viscosity(mPa·s/25°C)	<200
Property	pH(5%aq.)	10.0-12.0
Spec.	OH value(mmol/g-solid)	9.9
Property	Amine value(mmol/g-solid)	9.9
Spec.	Molecular weight	Approx.1400
Property	Mole ratio(OH/N)	1.0
Spec.	Specific gravity(20°C)	1.08
Property	Amine ratio	All tertiary amine
Spec.	Solubility	Soluble in water, alcohol
CAS No.		Not registered

POLYMENT

(Aminoethylated Acrylic Polymers)

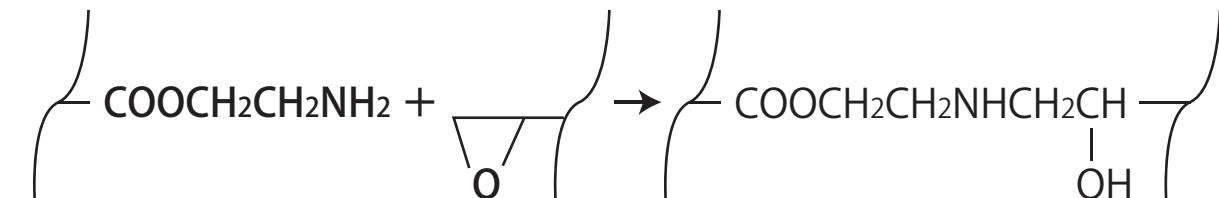

POLYMENT is an acrylic polymer containing primary amino group due to the grafting of polyethyleneimine in its side chain.

POLYMENT is a polyacrylamine that has the features of both polyethyleneimine and acrylic polymer. **POLYMENT** shows high reactivities thanks to its amino group and superior adhesiveness to various base materials. Cationic acrylic polymers are generally known as being tertiary amine and quaternary ammonium polymers, such as dimethylaminoethyl acrylate or dimethylaminoethyl methacrylate polymer.

POLYMENT is the only cationic acrylic polymer with primary amine in the world.

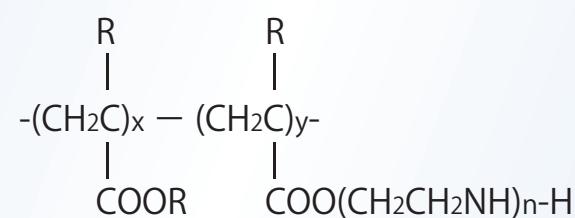

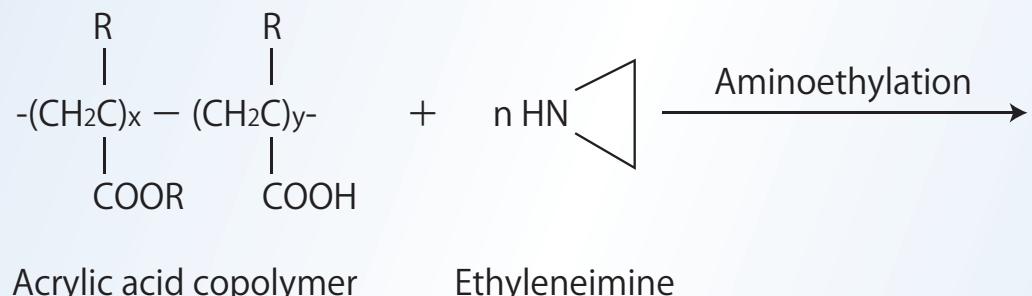

Characteristic of POLYMENT

POLYMENT is grouped into two types according to its form. Type one is a water-dilutable resin that can be diluted in water by neutralizing amino groups, and type two is a solvent-based resin that is synthesized under solvent conditions. Both types have primary amino groups, which gives them excellent reactivity with epoxy resins, and superior adhesion to base materials such as plastics and metals, etc.

Manufacturing method of POLYMENT

Using the reactivity of ethyleneimine and carboxyl groups, acrylic acid copolymers can be easily converted to acrylic polymers with primary amines.

Type	Water dilutable	Solvent based
Product	NK-100PM, NK-200PM	NK-350, NK-380
Structure		
Characteristic	<ul style="list-style-type: none"> • Water soluble • Self emulsification type hardening agent of epoxy resin • Room temperature reactivity with epoxy resin • Superior adhesion • Superior water and chemical resistance, and barrier property 	<ul style="list-style-type: none"> • Solvent soluble • Room temperature reactivity with epoxy resin • Superior adhesion • Superior water and chemical resistance, and barrier property
Application	<ul style="list-style-type: none"> • Water based for floor paints • Primer for olefin films 	<ul style="list-style-type: none"> • Primer for pressure-sensitive adhesive tape • Adhesive promoting agents and primer for films • Adhesives of fluorine film with Steel (NK-350) • Antimigration agent for PVC film (NK-380)
